■ Maximum permissible voltage change per unit of time

Rated Voltage (Vac)	dV/dt(V/us) at 440 Vdc				
	P=10mm	P=15mm	P=22.5mm	P=27.5mm	P=37.5mm
305	100	90	50	35	25

Note:

1. Rated voltage pulse slope $(dV/dt)_R$ at rated voltage.
2. If the working voltage(U) is lower than the rated voltage(U_R),the capacitor can be worked at a higher dV/dt. In this case, the maximum allowed dV/dt is obtain by multiplying the right value with U_R/U.

■ Soldering suggestions

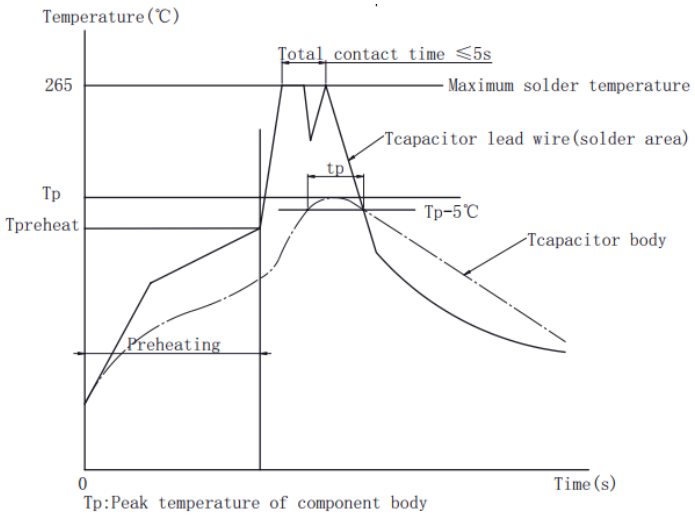
▲ Manual soldering

Max. temperature: 350℃, time: 3s

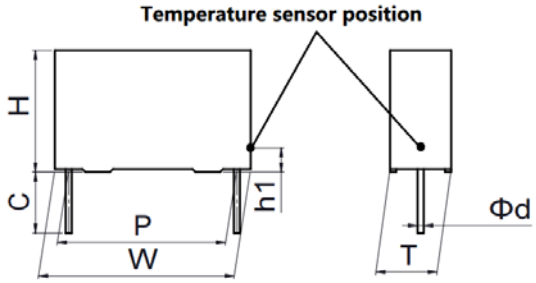
▲ Wave soldering

There are many factors affecting the heating of film capacitor during the wave soldering process, such as: preheating temperature, preheating time, soldering temperature, soldering time, other heat sources influence and so on.

The typical soldering profile is as below:



▲ Because overheating could damage the capacitor, we recommend paying attention to the maximum capacitor temperature and heating time, use temperature sensor to detect the maximum capacitor body temperature.



Note: If re-working or dipping twice is necessary, it should be done after the capacitor returns to the normal temperature.

■ Storage conditions

▲ It must be noted that the solderability of the terminals may be deteriorated when stored in an atmosphere filled with moisture, dust, or a reactive oxidizing gas.(hydrogen chloride, hydrogen sulfide, sulfuric acid,etc.)

▲ It shouldn’ t be located in particularly high temperature and high humidity, it must submit to the following conditions(unchanging primal package):

Temperature：-40 °C to 35 °C

Humidity：Average per year≤ 70%RH;

For 30 full days randomly distributed throughout the year≤ 80%RH

Storage time for tinned lead wire: (from the date marked on the capacitor’ s body or the label glued to the package) :

Bulk(packed with plastic bag): ≤ 24 months ;

Taping and line up: ≤ 12 months
